

## COMMUNICATION ABOUT SPAN TABLES FOR ACH SANDWICH PANELS

### Clarification about maximum overloads shows in ACH sandwich panel technical sheets:

The values indicated on the ACH sandwich technical sheets can only be used for precalculation studies, due it is impossible to present the multiple variants to which each project can be conditioned; the main ones are listed below:

- Maximum deflection allowed.
- Color group of the outer face of the panel, according to the UNE EN 14509 standard.
- Allowable temperature coefficient.

In addition, local regulations that may be included in the project should also be considered due to special characteristics of building and / or its location.

Saint Gobain Transformados S.A.U., will not be responsible for possible incidents due to the use of these tables for the calculation of the maximum span allowable, if you have not previously consulted with our Technical Department.
